Be Ready "Before The Moment"

Modulus Rotate or Lock Instructions

The Modulus system components are designed to either Rotate or Lock on the Pro Speed Belt and the Speed Belt Packs (Demon, Freak, and Racer).

Rotate: This means that the Modulus component can slide along the belt to the position you prefer. The advantage is that the components can be pulled forward or pushed back along the belt at any time, to access gear or to distribute the weight.

Lock: This means that the Modulus component can be locked in one position along the belt.

"Rotate" Attachment:

Step 1: Release the hook and loop flap from behind the Modulus component. Wrap it around the Pro Speed Belt so that the plastic tongue is **BEHIND** the belt (*important detail*).

Step 2: Reattach the hook and loop flap to the bag, and wrap the flaps securely around the side of the bag. When worn, this allows the bag to slide along the belt.

"Lock" Attachment:

Step 1: Follow the same steps as above, except insert the plastic tongue **INTO THE WEBBING SLOT** at the desired location.

Step 2: Reattach the hook and loop flap to the bag, and wrap the flaps securely around the side of the bag. When worn, this locks the bag in one position so that it cannot move.
